

Laser Ablation of a Biliary Duct for Treatment of a Persistent Biliary-Cutaneous Fistula.

Authors: Eicher C.A., Adelson A.B., Himmelberg J.A., Chintalapudi U.

Publication Date: 2008

Abstract:

A persistent biliary-cutaneous fistula detected after biliary drainage catheter removal could not be resolved with diversionary techniques and Gelfoam and fibrin glue administration in the fistulous tract. As an alternative approach for treatment of the fistula, obliteration of the contributing bile duct with laser ablation was performed. © 2008 SIR.
