

[Closure of vesicovaginal fistulas from the urologic viewpoint with reference to endoscopic fibrin glue technique]. [German]

Authors: Schneider JA, Patel VJ, Hertel E

Publication Date: 1992

Abstract:

Indications and results of conventional operative closure of iatrogenic vesicovaginal fistulas (24 patients) and exclusively endoscopic fibrin sealing (6 patients) have been reported. The primary closure rate of the first mentioned method is 88 per cent, but 66 per cent in cases of endoscopic fibrin sealing. The last method is reported in detail.
