## **Abstract:**

In a 14-year-old female patient the postoperative course of myectomy of the musculus rectus oculi externus on account of concomittant strabism was complicated by necrosis of the sclera (diameter 9 mm) at the site of intrascleral stitches and exudation into the anterior chamber and the vitreous body. For fixation of the transplant from lyophilized sclera the tissue glue Tissucol Kit was used. Tissucol rapidly and firmly joined the wound areas, its direct contact with uveal tissue did not produce an inflammatory reaction and the exudate from the anterior chamber and vitreous body was absorbed rapidly and completely.
