## **Abstract:**

Design of dedicated instrumentation and improvement in technique have allowed development of a simple, fast, and effective method of laparoscopic tubal anastomosis. We strongly recommend use of centering catheter. Salpingoplasty can be performed by the classic technique with 7/10 prolene but use of fibrin glue is reliable and greatly shortens procedure time. In a series of 17 patients on whom this method has been performed, 6 have become pregnant. Laparoscopic reestablishment of tubal patency should be proposed as the method of choice before attempting in vitro fertilization.
