Is the use of autologous platelet-rich plasma gels in gynecologic,

cardiac, and general, reconstructive surgery beneficial?. [Review]

Abstract:

Tissue repair at wound sites begins with clot formation, and subsequently platelet degranulation with

the release of platelet growth factors, which are necessary and well-regulated processes to achieve

wound healing. Platelet-derived growth factors are biologically active substances that enhance

tissue repair mechanisms, such as chemotaxis, cell proliferation, angiogenesis, extracellular matrix

deposition, and remodeling. This review describes the biological background and results on the

topical use of autologous platelet-rich plasma and platelet gel in gynecologic, cardiac, and general

surgical procedures, including chronic wound management and soft-tissue injuries.
